

Phase 1(Conception Phase)

Title: Pre Code Unit Test Case Generator for Test Driven Development

In modern software engineering many organizations require developers to create unit test cases before implementing actual code as part of Test-Driven Development. This process is often done manually with excel sheets. This approach is repetitive takes a lot of time and is prone to human errors. Developers will spend a lot of time documenting inputs and expected across edge cases instead of concentrating on system design and implementation. This leads to decreased productivity and inconsistencies across teams. Before implementing code, the suggested system's Pre-Code Unit Test Case Generator generates organized unit test cases. Through a user-friendly web interface, developers provide the planned function or method details, such as name, input parameters, expected behavior, and boundary conditions. Following then, the system uses predefined guidelines to generate suitable unit test cases, which are then saved in a standard Excel sheet format for corporate use. The system aims to improve developer productivity, maintain documentation consistency, and promote test-driven development practices by accelerating the pre-coding test case generation process. The expected outcome will be a standardized and time-saving solution that accelerates development process, enhances software quality overall, and makes it easier to prepare of unit test cases.
